<ロ> <回> <回> <三> <三> <三> <三> <三> <三> <三</p>

Observation: $\lim_{x\to+\infty} \frac{\bar{\Lambda}(x)}{e^{-x}} = 1$, $\forall \alpha > 0$. Thus for $\Lambda \in MDA(\Lambda)$ we have $\bar{\Lambda} \sim e^{-x}$. Does this (or smth. similar) generally hold for members of $MDA(\Lambda)$?

◆□▶ ◆□▶ ◆□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

Observation: $\lim_{x\to+\infty} \frac{\bar{\Lambda}(x)}{e^{-x}} = 1$, $\forall \alpha > 0$. Thus for $\Lambda \in MDA(\Lambda)$ we have $\bar{\Lambda} \sim e^{-x}$. Does this (or smth. similar) generally hold for members of $MDA(\Lambda)$?

Theorem: $(MDA(\Lambda))$

Let *F* be a distribution function with right endpoint $x_F \le \infty$. $F \in MDA(\Lambda)$ holds iff there exists a $z < x_F$ such that *F* can be represented as

$$\bar{F}(x) = c(x)exp\left\{-\int_{z}^{x} \frac{g(t)}{a(t)}dt\right\}, \forall x, z < x \leq x_{F},$$

where the functions c(x) and g(x) fulfill $\lim_{x\uparrow x_F} c(x) = c > 0$ and $\lim_{t\uparrow x_F} g(t) = 1$, and a(t) is a positive absolutely continuous function with $\lim_{t\uparrow x_F} a'(t) = 0$.

Observation: $\lim_{x\to+\infty} \frac{\bar{\Lambda}(x)}{e^{-x}} = 1$, $\forall \alpha > 0$. Thus for $\Lambda \in MDA(\Lambda)$ we have $\bar{\Lambda} \sim e^{-x}$. Does this (or smth. similar) generally hold for members of $MDA(\Lambda)$?

Theorem: $(MDA(\Lambda))$

Let *F* be a distribution function with right endpoint $x_F \le \infty$. $F \in MDA(\Lambda)$ holds iff there exists a $z < x_F$ such that *F* can be represented as

$$\bar{F}(x) = c(x)exp\left\{-\int_{z}^{x} \frac{g(t)}{a(t)}dt\right\}, \forall x, z < x \leq x_{F},$$

where the functions c(x) and g(x) fulfill $\lim_{x\uparrow x_F} c(x) = c > 0$ and $\lim_{t\uparrow x_F} g(t) = 1$, and a(t) is a positive absolutely continuous function with $\lim_{t\uparrow x_F} a'(t) = 0$.

See the book by Embrechts et al. for the proofs of the above theorem and of the following theorem concerning the characterisation of $MDA(\Lambda)$.

Theorem: (*MDA*(Λ), alternative characterisation) A distribution function *F* belongs to *MDA*(Λ) iff there exists a positive function \tilde{a} such that

$$\lim_{x\uparrow x_{F}}\frac{\bar{F}(x+u\tilde{a}(x))}{\bar{F}(x)}=e^{-u},\forall u\in{\rm I\!R}$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

A possible choice for \tilde{a} is $\tilde{a}(x) = a(x)$ with $a(x) := \int_x^{x_F} \frac{\tilde{F}(t)}{\tilde{F}(x)} dt$.

Theorem: ($MDA(\Lambda)$, alternative characterisation) A distribution function F belongs to $MDA(\Lambda)$ iff there exists a positive function \tilde{a} such that

$$\lim_{x\uparrow x_F}\frac{\bar{F}(x+u\tilde{a}(x))}{\bar{F}(x)}=e^{-u}, \forall u\in {\rm I\!R}$$

A possible choice for \tilde{a} is $\tilde{a}(x) = a(x)$ with $a(x) := \int_{x}^{x_{F}} \frac{\tilde{F}(t)}{\tilde{F}(x)} dt$.

Definition: The function a(x) above is called **mean excess function** and it can be alternatively represented as

$$a(x) := E(X - x | X > x), \forall x \leq x_F$$

◆□▶ ◆□▶ ◆□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

Theorem: ($MDA(\Lambda)$, alternative characterisation) A distribution function F belongs to $MDA(\Lambda)$ iff there exists a positive function \tilde{a} such that

$$\lim_{x\uparrow x_F} \frac{\bar{F}(x+u\tilde{a}(x))}{\bar{F}(x)} = e^{-u}, \forall u \in {\rm I\!R}$$

A possible choice for \tilde{a} is $\tilde{a}(x) = a(x)$ with $a(x) := \int_x^{x_F} \frac{\tilde{F}(t)}{\tilde{F}(x)} dt$.

Definition: The function a(x) above is called **mean excess function** and it can be alternatively represented as

$$a(x) := E(X - x | X > x), \forall x \leq x_F$$

Examples: The following distributions belong to $MDA(\Lambda)$:

- Normal: $F(x) = (2\pi)^{-1/2} \exp\{-x^2/2\}, x \in \mathbb{R}.$
- Exponential: $f(x) = \lambda^{-1} \exp\{-\lambda x\}, x > 0, \lambda > 0.$
- Lognormal: $f(x) = (2\pi x^2)^{-1/2} \exp\{-(\ln x)^2/2\}, x > 0.$
- Gamma: $f(x) = \frac{\beta^{\alpha}}{\Gamma(\alpha)} x^{\alpha-1} \exp\{-\beta x\}, x > 0, \alpha, \beta > 0.$

Histogram

- Histogram
- Quantile-quantile plots

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with unknown distribution \tilde{F} . We assume that the right range of \tilde{F} can be approximated by a known distribution F.

◆□▶ ◆□▶ ◆□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

Question: How to check whether this assumption holds?

- Histogram
- Quantile-quantile plots

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with unknown distribution \tilde{F} . We assume that the right range of \tilde{F} can be approximated by a known distribution F.

Question: How to check whether this assumption holds?

Let $x_n \leq x_{n-1} \leq \ldots \leq x_1$ be a sorted sample of X_1, X_2, \ldots, X_n . qq-plot: $\{(x_k, F^{\leftarrow}(\frac{n-k+1}{n+1})): k = 1, 2, \ldots, n\}.$

Histogram

Quantile-quantile plots

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with unknown distribution \tilde{F} . We assume that the right range of \tilde{F} can be approximated by a known distribution F.

Question: How to check whether this assumption holds?

Let $x_n \leq x_{n-1} \leq \ldots \leq x_1$ be a sorted sample of X_1, X_2, \ldots, X_n . qq-plot: $\{(x_k, F^{\leftarrow}(\frac{n-k+1}{n+1})): k = 1, 2, \ldots, n\}.$

If the assumption is plausible then the qq-plot is similar to the graph of a linear function. This property holds also if the reference distribution and the real distribution do not coincide but are of the same type.

Histogram

Quantile-quantile plots

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with unknown distribution \tilde{F} . We assume that the right range of \tilde{F} can be approximated by a known distribution F.

Question: How to check whether this assumption holds?

Let $x_n \leq x_{n-1} \leq \ldots \leq x_1$ be a sorted sample of X_1, X_2, \ldots, X_n . qq-plot: $\{(x_k, F^{\leftarrow}(\frac{n-k+1}{n+1})): k = 1, 2, \ldots, n\}.$

If the assumption is plausible then the qq-plot is similar to the graph of a linear function. This property holds also if the reference distribution and the real distribution do not coincide but are of the same type.

Rule of thumb: the larger the quantile the heavier the tails of the distribution!

The Hill estimator

<ロ> <個> < 国> < 国> < 国> < 国> < 国> < 回> < <</p>

The Hill estimator

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with distribution function F, such that $\overline{F} \in RV_{-\alpha}$, $\alpha > 0$, i.e. $\overline{F}(x) = x^{-\alpha}L(x)$ with $L \in RV_0$.

Goal: Estimate α !

The Hill estimator

Let X_1, X_2, \ldots, X_n be i.i.d. r.v. with distribution function F, such that $\overline{F} \in RV_{-\alpha}$, $\alpha > 0$, i.e. $\overline{F}(x) = x^{-\alpha}L(x)$ with $L \in RV_0$. Goal: Estimate $\alpha!$

Theorem: (Theorem of Karamata) Let *L* be a slowly varying locally bounded function on $[x_0, +\infty)$ for some $x_0 \in \mathbb{R}$. Then the following holds:

(a) For $\kappa > -1$: $\int_{x_0}^x t^{\kappa} L(t) dt \sim K(x_0) + \frac{1}{\kappa+1} x^{\kappa+1} L(x)$ for $x \to \infty$, where $K(x_0)$ is a constant depending on x_0 .

(8)

◆□▶ ◆□▶ ◆□▶ ▲□▶ ▲□ ◆ ○ ◆ ○ ◆

For the empirical distribution $F_n(x) = \frac{1}{n} \sum_{k=1}^n I_{[x_k,\infty)}(x)$ and a large threshold x_k depending on the sample $x_n \le x_{n-1} \le \ldots \le x_1$ we get:

$$E\left(\ln(X) - \ln(x_k)|\ln(X) > \ln(x_k)\right) \approx$$

$$\frac{1}{\bar{F}_n(x_k)}\int_{X_k}^{\infty} (\ln x - \ln x_k) dF_n(x) = \frac{1}{k-1}\sum_{j=1}^{k-1} (\ln x_j - \ln x_k).$$

Assumption: F is locally bounded on $[u, +\infty)$.

The theorem of Karamata implies: $E(\ln(X) - \ln(u)|\ln(X) > \ln(u)) =$

$$\lim_{u\to\infty}\frac{1}{\bar{F}(u)}\int_{u}^{\infty}(\ln x - \ln u)dF(x) = \alpha^{-1}.$$
(8)

For the empirical distribution $F_n(x) = \frac{1}{n} \sum_{k=1}^n I_{[x_k,\infty)}(x)$ and a large threshold x_k depending on the sample $x_n \le x_{n-1} \le \ldots \le x_1$ we get:

$$E\left(\ln(X) - \ln(x_k)|\ln(X) > \ln(x_k)\right) \approx$$

$$\frac{1}{\bar{F}_n(x_k)}\int_{X_k}^{\infty} (\ln x - \ln x_k) dF_n(x) = \frac{1}{k-1}\sum_{j=1}^{k-1} (\ln x_j - \ln x_k).$$

If $k = k(n) \rightarrow \infty$ and $k/n \rightarrow 0$, then $x_k \rightarrow \infty$ for $n \rightarrow \infty$, and (8) implies:

$$\lim_{n \to \infty} \frac{1}{k - 1} \sum_{j = 1}^{k - 1} (\ln x_j - \ln x_k) \stackrel{d}{=} \alpha^{-1}$$
